

PHP: Exchange Value of Variables

When exchanging the values of two variables, a third 'temp' variable is generally constructed to temporarily store one of the variables while the exchange is performed.

Here below a simple example:

```
if ($exchange) {  
    $temp = $v1;  
    $v1 = $v2;  
    $v2 = $temp  
  
}
```

There is however a more elegant way in PHP using the language construct list:

```
if ($exchange) {  
    list($v1,$v2) = array($v2,$v1);  
}
```
