

# Javascript: Date and Time

Last Updated mercoledi, 28 novembre 2007

Date is the Javascript object for current date and time (performing also some operations on it). The code here below shows a date in the day/month/year format

```
var d = new Date();  
var dt = (d.getDate() + "/" + (d.getMonth()+1)+ "/" + d.getFullYear());  
document.write(dt);
```

The table below shows instead the most important Date class methods:

Method	Description
getDate()	day of the month
getFullYear()	Year (four digits)
getHours()	Hours
getMinutes()	Minutes
getMonth()	Month (- 1)
getSeconds()	Seconds
getTime()	Unix Epoque value
toString()	convert date to a string
toUString()	convert date to a UTC string
