Javascript: inArray

Here below a simple example to build a inArray Javascript method
simil to PHP function.

This solution should work fairly well on relatively small lists of items.

```javascript
Array.prototype.inArray = function (value) {

  var i;

  for (i=0; i < this.length; i++) {

    if (this[i] === value) {

    return true;

    }

  }

  return false;

};
```

The method searches for an identical value, rather than a similar one. If you want just a similar value (the string "003" should match for example with the integer 3), this could be changed by replacing "===" with "==" in line 4.

To use the function have a look at the below example:

```javascript
if (MyArray.inArray('value')) {

  alert('value found');

}
```
