

Prototype and jQuery conflict

Prototype and jQuery are two powerful javascript library sets really useful for web pages development and required for a lot of useful free effect scripts available on the net (transparent image effects, sliding and fading image effects etc).

The two libraries require however a small trick to be used together. Here below a simple code to avoid any function assignment conflicts:

```
<script type="text/javascript" src="jquery.js"></script>

<script type="text/javascript">

  JQ = $; //rename $ function

</script>

<script type="text/javascript" src="prototype.js"></script>
```

All the jQuery function calls have to be done of course by the new FQ prefix instead of the original \$ on as per the following example:

```
FQ(document).ready(function(){

  FQ(".button-slide").click(function(){

    FQ("#panel").slideToggle("slow");

    FQ(this).toggleClass("active");

  });

});
```
